Re
Urllib
Requests
Pdfminer
Docx
Google Trans

To start the application

- Open command prompt
- Go to the project folder (where the script.py file is present)
- Run the following command

```
python script.py
```

- up on running the command you will get an IP address where our application is hosted on our local machine
- Go to any web browser and enter that IP address

That's it , you will land on our project home page !!!

To access anything on home page , right click on the button and select "open in new tab" .

it will open a new tab with that functionality.

Input options

you are given with 3 choices of input types .

- you can write or paste your text in the text area.
- you can upload a file
- give the website link of your choice .

Also there are some sliders that you can scroll horizontally to select a number for respective options.

Drop down lists are present , u have to select your option from that list of choices.

prompts are given to enter text , enter link , upload file where ever it is necessary.

Output

you will be redirected to the output page when ever you click on submit button of any functionality.

Stop the application

After your work is done , go to the same command prompt where you started , press

| CTRL + C

it will stop running the application on the local host .

close all the browser tabs that are related to application.
